

Bringing Business Processes under Control

The PLM Workflow solution extends the base functionality of Model Manager allowing users to manage and control their business processes, through graphical workflow descriptions.

PLM Workflow allows creation of graphically defined workflows that can be updated as your business processes change and improve. There are no programming skills required; with less than a day's training you will be building and deploying your own workflows.

In today's competitive climate it is vital to be in charge of your business processes. PLM Workflow allows you to automate your business processes and bring them under control. There are no limits on the number of different workflows you can build to manage your business processes. From engineering change, to new product development or even simple document signoff, PLM Workflow delivers control through visibility, traceability and accountability.

Main Features

PLM Workflow allows you to:

- Quickly create new workflows using a graphical interface from simple three step processes to complex multi-step procedures covering many paths
- Refine existing workflow definitions to deliver improved efficiency
- Provide visual feedback of process through a graphical preview
- Keep track of processes without the need for separate lists or paper trails
- Maintain an accurate audit trail

Benefits

- Improve profitability through process efficiency
- Identify bottlenecks and reduce lead times
- Quickly identify the stage any process has reached by checking the graphical preview
- Maintain a full audit trail providing traceability and accountability at all stages
- Email notification keeps stakeholders informed
- Process is controlled at all stages as working documents are taken through the process and approved, moved on or declined as defined by the process rules
- Eliminate delays and lost information due to poorly defined manual processes
- Tasks can be re-assigned to other members of the same group allowing for holidays/sickness and preventing unnecessary delays

- Built in timeout rules keep users on task if actions have not been completed ensuring the process is kept on track
- Simple design using intuitive graphical layout tools brings users up to speed quickly without requirement of expensive training
- Easily configured and maintained

System Requirements

Model Manager V19 or later.
Microsoft Windows 7,8 and 10 Client

Licensing

PLM Workflow is licensed as a single user floating license. For larger organisations, PLM Workflow can be supplied as a 25 multi-user license bundle. In addition PLM Workflow can be purchased as a license bundle with PDM Anydocs.

Installation and Administration

The administration and configuration of this module is all carried out through the standard Model Manager Administration user interface.
